Emotions, Technology, and Health examines how healthcare consumers interact with health technology, how this technology mediates interpersonal interactions, and the effectiveness of technology in gathering health-related information in various situations. The first section discusses the use of technology to monitor patients' emotional responses to illness and its treatment, as well as the role of technology in meeting the fundamental human need for information. Section Two describes the use of technology in mediating emotions within and between individuals, and addresses the implications for the design and use of devices that gather behavioral health data and contribute to healthcare interventions. The final section assesses different situations in which technology is a key component of the health intervention—such as tablet use in educating elementary school students with social skills difficulty, physical activity monitoring for children at risk for obesity, and teleconferencing for older adults at risk of social isolation. Shows how information on the internet significantly affects the medical decision-making process for many consumers Describes current applications of social computing and quick access to mental health information on portable electronic devices Discusses how cyber-communication may both impair and enhance one's sense of humanity Details the role of visual media in mediating emotion and memory of time

Despite its small size, Trinidad and Tobago ranks highly on a number of economic development indicators. The outcome of this paper shows that Web 2.0 tools offer many possibilities in order to retain customers and especially the two applications Facebook and Twitter can be used therefor. However, by implementing Web 2.0 tools into a company's marketing strategy also problems can occur, especially if not used with sufficient knowledge. Looking at the example of the social network platform Facebook, one can see that the wrong utilization of corporate pages can lead to inconsistency of the published information and the general company image. Furthermore users can feel over-spammed and thus, can prompt negative feelings for a brand or a company. Nevertheless future-looking companies, which want to stay competitive and differentiate from their competitors, are offered great chances by Web 2.0 tools, such as active communication with customers, segmentation and targeting, building of trust and acceptance, establishing enthusiasm and emotions or identifying trends and collecting customer data. Thus, the usage of Web 2.0 tools can create value for companies, by means of increased brand awareness, customer satisfaction, customer loyalty, and as a result higher customer retention. In a first step the term Web 2.0 is discussed and furthermore the respective tools are described and their understanding is supported by popular examples of Web 2.0 applications. As a second part this thesis will treat the topic of customer retention, possible opportunities and threats and how to manage it. As a last step the beforehand defined Web 2.0 tools are analyzed according to their applicability for customer retention. The most elaborate part of this step includes the comparison of the two Web 2.0 applications Facebook and Twitter as for their suitability for various beforehand defined processes of the different phases of customer retention. Those two applications were chosen due to recent events and popularity of both, at the time this thesis were written.

This book grew out of the First Symposium on the Personal Web, co-located with CASCON 2010 in Markham, Ontario, Canada. The purpose of the symposium was to bring together prominent researchers and practitioners from a diverse range of research areas relevant to the advancement of science and practice relating to the Personal Web. Research on the Personal Web is an outgrowth of the Smart Internet initiative, which seeks to extend and transform the web to be centred on the user, with the web as a calm platform ubiquitously providing cognitive support to its user and his or her tasks. As with the preceding SITCON workshop (held at CASCON 2009), this symposium involved a multi-disciplinary effort that brought together researchers and practitioners in data integration; web services modelling and architecture; human-computer interaction; predictive analytics; cloud infrastructure; semantics and ontology; and industrial application domains such as health care and finance. The discussions during the symposium dealt with different aspects of the architecture and functionality needed to make the Personal Web a reality. After the symposium the authors reworked their presentations into draft chapters that were submitted for peer evaluation and review. Every chapter went through two rounds of reviewing by at least two independent expert reviewers, and accepted chapters were then revised and are presented in this book.

Scientists from academic and the paper industry compile as many aspects of testing properties of paper as possible into a broad reference to help people who plan, specify, and evaluate the physical and mechanical testing of paper material take advantage of the many developments in recent years. An initial essay in each volume discusses the independent invention and widespread use of paper in Mesoamerica beginning sometime before AD 660. The two volumes are paged and indexed separately, but do not seem to be topically distinct. The first edition, Handbook of Physical and Mechanical Testing of Paper and Paperboard appeared in 1983; the second contains 30 chapters, a third of which are new and the others substantially revised, updated, and expanded. c.
