The theory of the sick lobe states that breast carcinoma is a lobar disease developing most often within a single lobe, meaning that, at an early stage, breast carcinoma occupies a limited, anatomically well-defined portion of the breast. This theory unites observed patterns from the genetic, developmental and morphological perspectives, into an overall concept. Breast Cancer: A Lobar Disease, presents this hypothesis and its consequences. The body of evidence, pro and contra, generated in recent years will be presented in this volume. The chapters, all authored by leading experts in their respective areas, gather evidence from the perspectives of epidemiology, genetics, radiology, anatomy, developmental biology, morphology, endoscopy, ultrasound and therapeutics to give the reader a full picture of recent developments regarding the sick lobe hypothesis. Tibor Tot, MD PhD is Head of the Pathology and Clinical Cytology Department at the Central Hospital of Falun, in Sweden; breast cancer expert of the National Board of Health and Welfare in Sweden; and regular Course Director of the breast pathology program, the official educational program for Swedish residents in clinical pathology, oncology, radiology and surgery.

From the interior of the Sun, to the upper atmosphere and near-space environment of Earth, and outward to a region far beyond Pluto where the Sun's influence wanes, advances during the past decade in space physics and solar physics--the disciplines NASA refers to as heliophysics--have yielded spectacular insights into the phenomena that affect our home in space. Solar and Space Physics, from the National Research Council's (NRC's) Committee for a Decadal Strategy in Solar and Space Physics, is the second NRC decadal survey in heliophysics. Building on the research accomplishments realized during the past decade, the report presents a program of basic and applied research for the period 2013-2022 that will improve scientific understanding of the mechanisms that drive the Sun's activity and the fundamental physical processes underlying near-Earth plasma dynamics, determine the physical interactions of Earth's atmospheric layers in the context of the connected Sun-Earth system, and enhance greatly the capability to provide realistic and specific forecasts of Earth's space environment that will better serve the needs of society. Although the recommended program is directed primarily at NASA and the National Science Foundation for action, the report also recommends actions by other federal agencies, especially the parts of the National Oceanic and Atmospheric Administration charged with the day-to-day (operational) forecast of space weather. In addition to the recommendations included in this summary, related recommendations are presented in this report.

Colonial Canada changed enormously between the 1760s and the 1860s, the Conquest and Confederation, but the idea of civilization seen to guide those transformations changed still more. A cosmopolitan and optimistic theory of history was written into the founding Canadian constitution as a check on state violence, only to be reversed and undone over the next century. Civilization was hegemony, a contradictory theory of unrestrained power and restraints on that power. Occupying a middle ground between British and American hegemonies, all the different peoples living in Canada felt those contradictions very sharply. Both Britain and America came to despair of bending Canada violently to their will, and new forms of hegemony, a greater reckoning with soft power, emerged in the wake of those failures. E.A. Heaman shows that the view from colonial Canada matters for intellectual and political history. Canada posed serious challenges to the Scottish Enlightenment, the Pax Britannica, American manifest destiny, and the emerging model of the nation-state. David Hume's theory of history shaped the Canadian imaginary in constitutional documents, much-thumbed histories, and a certain liberal-conservative political and financial orientation. But as settlers flooded across the continent, cosmopolitanism became chauvinism, and the idea of civilization was put to accomplishing plunder and predation on a transcontinental scale. Case studies show crucial moments of conceptual reversal, some broadly representative and some unique to Canada. Dissecting the Seven Years' War, domestic relations, the fiscal military state, liberal reform, social statistics, democracy, constitutionalism, and scholarly history, Heaman shows how key British and Canadian public figures grappled with the growing gap between theory and practice. By historicizing the concept of civilization, this book connects

Enlightenment ideals and anti-colonialism, shown in contest with colonialism in Canada before Confederation.

This book explores the rich and deep interplay between mathematics and physics one century after David Hilbert's works from 1891 to 1933, published by Springer in six volumes. The most prominent scientists in various domains of these disciplines contribute to this volume providing insight to their works, and analyzing the impact of the breakthrough and the perspectives of their own contributions to mathematical physics, such as string theory, quantum gravity, noncommutative geometry, twistor theory, Gauge and Quantum fields theories, just to mention a few. The reader, accompanied on this journey by some of the fathers of these theories, explores some far reaching interfaces where mathematics and theoretical physics interact profoundly and gets a broad and deep understanding of the journey is not confined to the present state of the art, but sheds light on future developments of the field, highlighting a list of open problems. Graduate students and researchers working in physics, mathematics and mathematical physics will find this journey extremely fascinating. All those who want to benefit from a comprehensive description of all the latest advances in mathematics and m
