

Polytechnic Mechanical 3rd Year Industrial Training Report

It is with great pleasure that we present to you a collection of over 200 high quality technical papers from more than 10 countries that were presented at the Biomed 2008. The papers cover almost every aspect of Biomedical Engineering, from artificial intelligence to biomechanics, from medical informatics to tissue engineering. They also come from almost all parts of the globe, from America to Europe, from the Middle East to the Asia-Pacific. This set of papers presents to you the current research work being carried out in various disciplines of Biomedical Engineering, including new and innovative researches in emerging areas. As the organizers of Biomed 2008, we are very proud to be able to come-up with this publication. We owe the success to many individuals who worked very hard to achieve this: members of the Technical Committee, the Editors, and the International Advisory Committee. We would like to take this opportunity to record our thanks and appreciation to each and every one of them. We are pretty sure that you will find many of the papers illuminating and useful for your own research and study. We hope that you will enjoy yourselves going through them as much as we had enjoyed compiling them into the proceedings. Assoc. Prof. Dr. Noor Azuan Abu Osman Chairperson, Organising Committee, Biomed 2008

This book provides engineers and students with a general framework focusing on the processes of designing new engineering products. The procedures covered by the framework lead the reader to the best trade-offs to ensure maximum satisfaction of the customer's needs, meeting the lowest cost expectations, ensuring the lowest environmental impact and maximising profits and best positioning in the marketplace. Chapters discuss the engineering tools that are compatible with these goals and sustainable activity. The design process is defined in terms of operators acting over the information space The information content is defined as a difference of entropies Creation and destruction of entropy are defined as procedures of the design process

Education and Skills for Inclusive Growth, Green Jobs and the Greening of Economies in Asia

In today's changing world, enterprises need to survive in an ever volatile competitive market environment. Their success will depend on the strategies they practice and adopt. Every year, new ideas and concepts are emerging in order for companies to become successful enterprises. Cross Border Enterprises is the new 'hot' topic arising in the business process world at present. Many terms have been coined together and are being driven in the popular business press to describe this new strategy of conducting business, ie. Extended Enterprise (Browne et al. , 1995; O'Neill and Sacket, 1994; Busby and Fan, 1993; Caskey, 1995), Virtual Enterprise (Goldmann and Preiss, 1991; Parunak, 1994; Goranson, 1995; Doumeingts et al. , 1995), Seamless Enterprise (Harrington, 1995), Inter-Enterprise Networking (Browne et al. , 1993), Dynamic Enterprise (Weston, 1996) and so on. Many people have argued that they mean the same thing, just using different words. Others feel they are different. But how different are they? In this paper the authors will present some basic lines required from this new strategy for conducting and coordinating distributed business processes (DBP), as well as trying to clarify the particularities of two of the widest spread terms related to it: Virtual and Extended Enterprise. 2 CLUSTERS OF PRESSURES The business world currently faces an increased trend towards globalisation, environmentally benign production and customisation of products and processes, forcing individual enterprises to work together across the value chain in order to cope with market influences.

An exceptionally readable training resource designed in a flexible "stand-alone" chapter format, this modern book gives future industrial technicians a solid foundation in basic theory coupled with a practical "hands-on" approach that includes exposure to real-life equipment used in the industry today. Using a direct and straightforward style of writing that has won praise from readers, it focuses on the needs of industrial mechanics, technicians and engineers working with industrial mechanical and power transmission products, and integrates safety and troubleshooting components within each chapter to encourage diagnostic skill-building.

This book presents an overview of the main research findings and case studies concerning education and skills for inclusive growth, green jobs and the greening of economies. Focusing on India, Indonesia, Sri Lanka and Viet Nam, it discusses government and business sector responses to these issues and how Technical and Vocational Education and Training (TVET) systems and institutions are addressing both the renewal of curricula in the context of green growth dynamics, and patterns of training and skills development to meet demands. In addition, the book examines cross-country issues, concerns and prospects regarding education and skills for inclusive growth and green jobs for the four countries. These include critical themes and issues in the selected industry sectors triggering a demand for green jobs in the region; how industry is responding to those demands; areas impeding the transition from traditional to green practices; the importance of skills development; the role of TVET in addressing industry needs; and reasons for the slow response of TVET to green skills. While other studies conducted in Asia – and internationally – on the same topic have largely relied on secondary sources, this study conducted by the Asian Development Bank and the Education University of Hong Kong (ADB-EduHK) is unique in that the findings, conclusions and recommendations reported on are based on primary data. As part of the study, TVET providers, business enterprises, policy makers and practitioners were surveyed using questionnaires and face-to-face interviews. In addition, workshops were held in each of the four countries to ascertain the views of key stakeholders in government, nongovernment organisations, members of the international development community, TVET providers and members of the business sector. The book also provides summaries of the case studies undertaken for India, Indonesia, Sri Lanka and Viet Nam.

This state-of-the-art text explores developments in geometric modeling, product modeling and their applications. In particular, it looks at the means by which product geometry emerges from the conceptual stages of design, and the use of geometric reasoning for applications downstream of design, including manufacture and assembly. Much existing design research is either totally geometry based or totally non-geometric, and the interface between the two areas is of intense interest to industry, as well as being crucial for the successful development of integrated systems for design and manufacture. This interface is currently not well understood and the book makes a significant contribution towards its understanding. This book is essential reading for technical managers and research and development engineers.

Papers and Summary of the Conference

An introduction to the fundamental concepts of solid materials and their properties The primary recommended text of the Council of Engineering Institutions for university undergraduates studying the mechanics of solids New chapters covering revisionary mathematics, geometrical properties of symmetrical sections, bending stresses in beams, composites and the finite element method Free electronic resources and web downloads support the material contained within this book **Mechanics of Solids** provides an introduction to the behaviour of solid materials and their properties, focusing upon the fundamental concepts and principles of statics and stress analysis. Essential reading for first year undergraduates, the mathematics in this book has been kept as straightforward as possible and worked examples are used to reinforce key concepts.

Practical stress and strain scenarios are also covered including stress and torsion, elastic failure, buckling, bending, as well as examples of solids such as thin-walled structures, beams, struts and composites. This new edition includes new chapters on revisionary mathematics, geometrical properties of symmetrical sections, bending stresses in beams, composites, the finite element method, and Ross's computer programs for smartphones, tablets and computers.

Tomsk is one of the oldest established centres of industry and learning in the Russian Federation. The city of Tomsk and its surrounding region now face challenging economic and resource utilisation problems. These must be overcome if the pace of devel

This book presents over 100 papers from the 3rd Engineering & Product Design Education International Conference dedicated to the subject of exploring novel approaches in product design education. The theme of the book is "Crossing Design Boundaries" which reflects the editors' wish to incorporate many of the disciplines associated with, and integral to, modern product design and development pursuits. Crossing Design Boundaries covers, for example, the conjunction of anthropology and design, the psychology of design products, the application of soft computing in wearable products, and the utilisation of new media and design and how these can be best exploited within the current product design arena. The book includes discussions concerning product design education and the cross-over into other well established design disciplines such as interaction design, jewellery design, furniture design, and exhibition design which have been somewhat under represented in recent years. The book comprises a number of sections containing papers which cover highly topical and relevant issues including Design Curriculum Development, Interdisciplinarity, Design Collaboration and Team Working, Philosophies of Design Education, Design Knowledge, New Materials and New Technologies in Design, Design Communication, Industrial Collaborations and Working with Industry, Teaching and Learning Tools, and Design Theory.

The Engineer is the chair of a technology trio who create innovations that complement or replace human effort, and enhance human development. The Technician is the artisan that transforms the Engineer's design sketches and calculations into working drawings and, ultimately into products that meet human needs, under the management and supervision of the Technologist. This book discusses extensively the unique attributes of engineering within the technology family and its prime role in human development, the numerous sub-disciplines of the profession, the distinctive skill sets that characterize each, the interdependence and complementarities of the many sub-specialties, the prime role of the engineer as the technology team leader, and the type of training required to produce a professional engineer in the main areas of specialization. The very bright career opportunities in engineering for both men and women are also discussed.

At the invitation of the regional authorities, the OECD organised a conference in Tomsk on a regional approach to industrial restructuring in June 1997. This report presents the economic assessment, conference conclusions and recommendations.

Proceedings of the 3rd Engineering & Product Design Education International Conference, 15-16 September 2005, Edinburgh, UK

The importance of proper geometric dimensioning and tolerancing as a means of expressing the designer's functional intent and controlling the inevitable geometric and dimensional variations of mechanical parts and assemblies, is becoming an increasingly important part of the design process. The efforts and innovations in the field of tolerancing design, the development of supporting tools, techniques and algorithms, and the significant advances in computing software and hardware all have contributed to its recognition as a viable and essential part of the design process. The field of tolerancing design is successfully making the transition to maturity where deeper insights and sound theories are being developed to offer explanations, and reliable implementations are introduced to provide solutions. The very early that manufacturing processes do not produce the nominal dimensions of designed parts. The notion of associating a lower and an upper limit, referred to as tolerances, with each dimension was introduced. Tolerances were specified for mating features. Fits of mating features included clearances, location fits, and interference fits, with various sub-grades in each category assigned a tolerance value depending on the nominal size of the mating features. During the inspection process, the dimension fell outside the specified range. As the accuracy requirements in assemblies became tighter, designers had to consider other critical dimensions and allocate tolerances to them in order to ensure the assembly's functionality.
