There are five sections in the first part (sections are dedicated to stereolithography, new techniques of high-resolution 3D printing, application of 3D printers in architecture and civil engineering, the additive production with the metal components and the management of production by using previously mentioned technology in more complex ways). There are four chapters in the second part with the following topics: education of medical staff through surgical simulations, tissue engineering and potential applications of 3D printing in ophthalmology and orthopedics.

The famous Lindbergh kidnapping in the 1930s was solved, in part, through a detailed analysis of the kidnapper's handwriting. Other criminal cases, such as selling phony manuscripts, forgery, and fraud can be broken with detailed analyses of handwriting, typewriting, photocopied documents, and the inks and papers used on documents. The science of analyzing documents has been growing for more than a century. In this book, readers will learn how to document analysis has helped solve various crimes, from kidnappings and famous forgeries, to bombings and other violent crimes. Readers will also see how document examiners present their findings in court. Crime leaves a paper trail—and document analysis provides the techniques for following that trail.

"Historically, the producers of colotype printing have been secretive and taken a proprietary attitude toward the production of colotype prints. Therefore, knowledge about and information on the growth of the colotype industry has been minimal. Although the colotype process produces prints that are among the most beautiful and delicate of any graphic arts medium, colotypes presently are rarely produced commercially or even as an artistic medium. Eventually, the making of colotypes will be a lost art. The primary objective of this thesis was to produce a portfolio of photographic images which illustrates all of the production steps in the making of a colotype print. Included with the photographic essay is a condensed history of colotype, a technical review of the colotype printing process, and analysis of the present state of colotype printing. This thesis endeavors to ensure that the techniques used to produce colotype prints are accurately documented. In addition, the thesis presents an illustrated record of the contemporary colotype printing process. To ensure the proper procedures and techniques necessary to produce a quality colotype print, a collaboration with an expert colotype printer was initiated. Thus, the colotype printing and subsequent photographic documentation was done with Kent Kirby at his Light-print Press in Alma, Michigan. Kirby is one of a handful of individuals working in colotype today, and his studio is one of the last remaining colotype studios in the world. He is an expert colotype printmaker and the author of Studio Colotype, (1988) the most comprehensive manual on colotype printing. Though his book contains extensive information about colotype, it lacks a visual narrative of the colotype process. In addition to the photographic documentation, there is a written description of the colotype printing process. This includes sections on the press, plate preparation, plate exposure, substrate information, printing techniques, ink and its application, and dampening solutions. This thesis project also includes a historical background of the process and an analysis concerning the state of contemporary colotype for commercial and artistic applications. The research includes information gathered during interviews with expert contemporary colotype printers such as Kent Rush of the University of Texas, San Antonio, James Hajicek of Arizona State University and Kent Kirby. In addition, interviews were conducted with Michael Intrator of Black Box Colotype, Andre DePolo of Alinari Archive, Florence, Italy, Ms. Leibiger of Lichtdruck Grafisches Zentrum fur Druckkunst, Dresden, Germany, and Tom Reardon, formerly with The Jaffe Heliochrome Press, New York as to their insight into the demise of the commercial colotype. The backbone of this thesis project is a portfolio of eighteen original black-and-white matted and mounted silver prints that photographically document the colotype process. In addition to the documentary photographs, the portfolio also contains an original photograph and an original colotype reproduction. These two images enable the reader to compare the original silver print photograph and a photomechanical reproduction of it."--Abstract.

The Apple Macintosh Encyclopedia provides easily accessible, brief and understandable information on the topics that you are most likely to have questions about. We have carefully digested the manuals, books, magazine articles, and other information sources for the Macintosh. These, combined with our own experience in using the Macintosh and other personal computers, have been integrated into an alphabetical sequence of short entries in the style of an encyclopedia. The goal is to understand information on a particular topic that is quickly accessible when you need it. Much of the information in the entries is not contained in the manuals provided with the Macintosh and various software products. For example, notice the discussion, under WIDTH, of the "deferred" nature of this command when used with a device name, the discussion of the colon (;) in Multiplan for ranges, or Saving, Problems With. These topics are omitted or inadequately covered in the standard manual for the visual computer. In keeping with the highly visual nature of using the Macintosh, we have provided over 100 illustrations. Each shows exactly what you will see on the screen when exploring topics discussed in the text. The Macintosh Encyclopedia opens with a visual guide to icons, and remains highly visual in orientation throughout the text.

This book continues first one of the same authors "Adaptive Image Processing Algorithms for Printing" and presents methods and software solutions for copying and scanning various types of documents by conventional office equipment, offering techniques for correction of distortions and enhancement of scanned documents; techniques for automatic cropping and de-skew; approaches for segmentation of text and picture regions; documents classifiers; approach for vectorization of symbols by approximation of their contour by curves; methods for optimal compression of scanned documents, algorithm for stitching parts of large originals; copy-protection methods by microprinting and embedding of hidden information to hardcopy; algorithmic approach for toner saving. In addition, method for integral printing is considered. Described techniques operate in automatic mode thanks to machine learning or ingenious heuristics. Most the techniques presented have a low computational complexity and memory consumption due to they were designed for firmware of embedded systems or software drivers. The book reflects the authors' practical experience in algorithm development for industrial R&D.
