Make It Stick

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education sets a bold set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

Concepts of Biology

Music Reading for Bass - The Complete Guide (Music Instruction)

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand.We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Science is everywhere, in everything we do, see, and read. Books-all books-offer possibilities for talk about science in the illustrations and text once you know how to look for them. Children's literature is a natural avenue to explore the seven crosscutting concepts described in the Next Generation Science Standards*, and with guidance from Valerie Bang-Jensen and Mark Lubkowitz, you will learn to develop the mindset necessary to think like a scientist, and then help your students think, talk, and read like scientists. Sharing Books Talking Science is an engaging and user-friendly guide that provides practical, real world understandings of complex scientific concepts using children's literature. By demonstrating how to work in a very familiar and comfortable teaching context-read aloud-to address what may be less familiar and comfortable content-scientific concepts-Valerie and Mark empower teachers to use just about any book in their classroom to help deepen students' understanding of the world. Valerie and Mark supply you with everything you need to know to get to the heart of each concept, including a primer, questions and strategies to spot a concept, and ways to prompt students to see and talk about it. Each chapter offers a list of suggested titles (many of which you probably already have) to help you get started right away, as well as "topic spotlight" sections that help you connect the concepts to familiar topics such as eating, seasons, bridges, size, and water. With Sharing Books Talking Science, you will have the tools and confidence to explore scientific concepts with your students. Learn how to "talk science" with any book so that you can infuse your curriculum with scientific thinking...even when you aren't teaching science. *Next Generation Science Standards is a registered trademark of Achieve. Between the 18th and 19th centuries, Britain experienced massive leaps in technological, scientific, and economical advancement. From everyday apps to complex algorithms, Raha Benjamin cuts through tech-industry hype to understand how emerging technologies can reinforce White supremacy and deepen social inequity. Benjamin argues that automation, far from being a sinister story of racist programmers scheming on the dark web, has the potential to hide, speed up, and deepen discrimination while appearing neutral and even benevolent when compared to the racism of a previous era. Presenting the concept of the "New Jim Code," she shows how a range of discriminatory designs encode inequity by explicitly amplifying racial hierarchies; by ignoring but thereby replicating social divisions; or by aiming to fix racial bias but ultimately doing quite the opposite. Moreover, she makes a compelling case for race itself as a kind of technology, designed to stratify and sanctify social injustice in the architecture of everyday life. This illuminating guide provides conceptual tools for decoding tech promises with sociologically informed skepticism. In doing so, it challenges us to question not only the technologies we are sold but also the ones we ourselves manufacture. Visit the book's free Discussion Guide here.
