When a patient comes in with a suspected infectious disease, knowledge is power. Now this knowledge is simplified, comprehensive and easy to find. The Pharmacist's Guide to Antimicrobial Therapy and Stewardship puts all the necessary information in one place, including: Evaluating potentially infected patients Identifying the infection's suspected source and related organisms Comparing the range of anti-infectives Knowing the factors that impact treatment Developing an antimicrobial stewardship program A step-wise approach walks logically from overall key concepts to disease- and drug-specific information. Disease states are summarized for easy reference. Tables make it easy to evaluate recommended treatment options. In infectious disease management, when answers are seldom black and white, this guide helps pharmacists make confident decisions.

With the widespread use of highly active anti-retroviral treatment (HAART), HIV has become a chronic, rather than a fatal, disease. But for their treatment to succeed, patients require uninterrupted care from a health care provider and uninterrupted access to anti-HIV medications. The IOM identifies federal, state, and private health insurance policies that inhibit HIV-

positive individuals from initiating or continuing their care.

The 2012 pocket edition is 20% thinner and lighter in*

weight than the 2011 edition due to new production methods, making the 2012 pocket edition handier than ever. We have also increased contrast of the text for greatly improved readability! The 42nd edition is available in a wide array of formats: the pocket edition, somewhat larger spiral bound edition, and larger library edition in print; Apps for iOS and Android devices; and the Web Edition. The digital editions provide us with a platform to update content regularly as developments warrant. The print editions continue to be our annual -snapshot- of the current state of the field of antimicrobial therapy. Highlights of the 42nd edition include the following areas: Resistance to antibacterial agents is increasing at an alarming pace. Materials on management of resistant gram-positive organisms, such as MRSA, and multi-drug resistant gram-negative bacilli, such as E. coli, (Tables 2, 5 and 6 in print) have been extensively updated and expanded. There is increasing clinical application of continuous, or prolonged, infusion of antibacterials for those drugs where

optimal efficacy correlates with time above MIC of the target bacteria: cefepime, ceftazidime, doripenem, meropenem, piperacillin-tazobactam. Hepatitis C (HCV) infects over 175 million people worldwide. Two new HCV protease inhibitors, boceprevir and telaprevir, were approved in 2011 for treatment of HCV. Many more drugs are in development in early 2012. Antiretroviral therapy options continue to expand with the approval of new drugs, such as rilpivirine, and new combination formulations of ARV drugs such as Complera. A newly approved macrolide, fidaxomicin, is included for treatment of moderate to severe C. difficile toxin-mediated diarrhea.
