This book examines the development of television in India since the early 1990s, and its implications for Indian society more widely. Until 1991, India possessed only a single state-owned television channel, but since then there has been a rapid expansion in independent satellite channels which came as a complete break from the statist control of the past. This book explores this transformation, explaining how television, a medium that developed in the industrial West, was adapted to suit Indian conditions, and in turn has altered Indian social practices, making possible new ways of imagining identities, conducting politics and engaging with the state. In particular, satellite television initially came to India as the representative of global capitalism but it was appropriated by Indian entrepreneurs and producers who Indianized it. Considering the full gamut of Indian television - from "national" networks in English and Hindi to the state of regional language networks - this book elucidates the transformative impact of television on a range of important social practices, including politics and democracy, sport and identity formation, cinema and popular culture. Overall, it shows how the story of television in India is also the story of India's encounter with the forces of globalisation.

This book describes the necessary equipment, platforms, and service options for setting up and running Internet TV systems. It covers the technologies, business, and content aspects along with operation and business parts. This 2nd edition has been updated information that covers how to use Internet TV Distribution services to setup channels on Internet TV marketplaces including Roku, Amazon Prime, Google TV, and others. Also includes new sections covering second screen, video advertising networks, and more.

Cutthroat is the name of the game on the electronic frontier. It requires an amoral flexibility with no allies, just alliances; no team loyalties, just self-interest. Strategy forms and dissolves with every play; a smile on the face may mean a knife in the back. In the next round, the players switch sides and do it again. Billions of dollars are at stake.Featuring a bitter struggle between Rupert Murdoch and John Malone, and a supporting cast that includes AJ Gore, Ted Turner, and Bill Gates, author Stephen Keating uses one particular mega-deal that went terribly wrong to reveal how these corporate titans flex market power, crush competition and reap the profits.In 1997, Murdoch's News Corp. joined forces with EchoStar, Charlie Ergen's upstart company, to create a satellite-TV powerhouse -- nicknamed Deathstar. They planned to bunch a cosmic armada of seven satellites that would deliver several hundred TV channels, internet, and retail services to millions of subscribers. How this deal challenged the entrenched cable-TV monopoly before it came crashing down to earth exposes the influence exerted by and through money, power, and political dynamics among the corporate players fighting to rule the communications world. The roots of this dramatic business conflict are revealed through the separate evolution -- and eventual collision -- of cable and satellite TV technologies. Cutthroat is the perfect book for anyone who enjoyed Barbarians at the Gate and Den of Thieves.

Television Goes Digital

Internet TV Systems

"Television Everywhere" is on the way. It's a generic term for using the internet to get TV to more devices in more places more conveniently - what you want, where you want, when you want it. It's far from a new idea. Plenty of futuristic notions of TV have been promoted in the past, usually by technologists with a shaky understanding of the television business. But this time Hollywood's content ownership combined with new, simple technol industry itself to take the lead and modernize television, while extending its economic life well into the future. More important than delivering TV through the internet is using the internet to retain and expand audiences for the TV we already have. That's what this book is about- why it's a problem worth solving, how to go about solving it, and how today's television industry will benefit from stepping in where cable companies, phone companies suppliers are failing miserably. Aimed primarily at Hollywood, this book is for studio, network, and channel executives, producers, show runners, ad agency strategists ("digital" or otherwise), media buyers, and executives at ratings/measurement companies. We describe how Hollywood can both extend the life of so-called linear television and control the transition to internet-delivered TV, while building upon existing "starter" digital assets su program-specific web properties and applications. Finally, this book is also a wake-up call to internet content and technology companies to take a fresh look at an old problem, using a comparatively new, low-cost set of approaches produced by the "Web 2.0" and cloud computing waves which emerged over the last several years.

The average cable bill in the U.S. costs $107 per month. We're here to tell you there's a better way. By taking simple steps like switching to a live streaming service, using a TV antenna, or taking advantage of free TV options, you can drastically cut that bill down, if not eliminate it entirely. In this book, you'll learn: - How to get free broadcast TV - What channels are available free where you live - What channels are available on which service available via the Internet - How to watch FREE TV and Movies via the Internet - Which devices support which services - How to use a DVR with an antenna - Which antenna do you need

With growth in access to high-speed broadband and 4G, and increased ownership of smartphones, tablets and internet-connected television sets, the internet has simultaneously begun to compete with and transform television. Online TV argues that these changes create the conditions for an emergent internet era that challenges the language and concepts that we have to talk about television as a medium. In a wide-ranging analysis, Catherine Johnson sets out a series of conceptual frameworks designed to provide a clearer language with which to analyse the changes to television in the internet era and to bring into focus the power dynamics of the online TV industry. From providing definitions of online TV and the online TV industry, to examining the ways in which technology, rights, interfaces and algorithms are used to control and constrain access to audiovisual content, Online TV is a timely intervention into debates about contemporary internet and television cultures. A must-read for any students, scholars and practitioners who want to understand and analyse the ways in which television is intertwining with and being transformed by the internet.
