With the growing integration of the international economy the international differences in financial reporting practices have never been so important in multinational business. Recent reforms in International Accounting Standards, combined with the continuing European harmonization, have placed this topic high on the current agenda of both researchers and of business analysts actively concerned with international accounting practice. This new, updated edition of Christopher Nobes' International Classification of Financial Reporting examines the causes and nature of the differences between financial reporting practices in different countries, charting all the many significant developments to have taken place through the 1980s. The relevant research published during this period is discussed, alongside the effects of the regulatory changes

that have taken place. Improvements in the existing system of classification in financial reporting are proposed in the light of the accelerated process of harmonization currently taking place. The resulting volume is an indispensable source for academics and professionals in international accounting and for all who are engaged in the process of European harmonization.

Expert Systems in Finance and Accounting

From the field's leading authority, the most authoritative and comprehensive advanced-level textbook on asset pricing *In Financial Decisions and Markets*, John Campbell, one of the field's most respected authorities, provides a broad graduate-level overview of asset pricing. He introduces students to leading theories of portfolio choice, their implications for asset prices, and empirical patterns of risk and return in financial markets. Campbell emphasizes the interplay of theory and evidence, as theorists respond to empirical puzzles by developing models with new testable implications. The book shows how models make predictions not only about asset prices but also about investors' financial positions, and how they often draw on insights from behavioral

economics. After a careful introduction to single-period models, Campbell develops multiperiod models with time-varying discount rates, reviews the leading approaches to consumption-based asset pricing, and integrates the study of equities and fixed-income securities. He discusses models with heterogeneous agents who use financial markets to share their risks, but also may speculate against one another on the basis of different beliefs or private information. Campbell takes a broad view of the field, linking asset pricing to related areas, including financial econometrics, household finance, and macroeconomics. The textbook works in discrete time throughout, and does not require stochastic calculus. Problems are provided at the end of each chapter to challenge students to develop their understanding of the main issues in financial economics. The most comprehensive and balanced textbook on asset pricing available, *Financial Decisions and Markets* is an essential resource for all graduate students and practitioners in finance and related fields. Integrated treatment of asset pricing theory and empirical evidence
Emphasis on investors' decisions
Broad view linking the field to financial econometrics, household finance, and macroeconomics
Topics treated in discrete time, with no requirement for stochastic calculus
