Contemporary Practice

Introduction to Clinical Mental Health Counseling presents a broad overview of the field of clinical mental health and provides students with the knowledge and skills to successfully put theory into practice in real-

world settings. Drawing from their experience as clinicians, authors Joshua C. Watson and Michael K. Schmit cover the foundations of clinical mental health counseling along with current issues, trends, and population-specific considerations. The text introduces students to emerging paradigms in the field such as mindfulness, behavioral medicine, neuroscience, recovery-oriented care, provider care, person-centered treatment planning, and holistic wellness, while emphasizing the importance of selecting evidence-based practices appropriate for specific clients, issues, and settings. Aligned with 2016 CACREP Standards and offering practical activities and case examples, the text will prepare future counselors for the realities of clinical practice.

The Department of Veterans Affairs--the VA--operates the nation's largest and most diverse health care system. How many physicians does it need to carry out its principal mission-related responsibilities of patient care, education, and research? This book presents and demonstrates by concrete example a methodology to answer this basic, but extraordinarily complex, question. The heart of the methodology is a decision-making process in which both statistical and expert judgment approaches can be used separately or in concert to calculate the number of physicians required, by specialty, for any facility in the VA system. Although the analyses here focus entirely on the VA, the methodology could be used to determine physician staffing for a wide range of public and private sector health care organizations.

AJN Book of the Year Based on the biological-psychological-sociological aspects of mental illness, this comprehensive textbook maintains its grounded focus in current research and continues to reflect current practice. The Third Edition includes a new NCLEX Tips box, more patient teaching points, highlighted nursing interventions, and more health promotion. The free CD-ROM features a new clinical simulation and other student learning activities. The ancillary package includes an Instructor's Resource CD-ROM with a Test Generator, Powerpoint slides, and Instructor's Manual.

Nearly 1.9 million U.S. troops have been deployed to Afghanistan and Iraq since October 2001. Many service members and veterans face serious challenges in readjusting to normal life after returning home. This initial book presents findings on the most critical challenges, and lays out the blueprint for the second phase of the study to determine how best to meet the needs of returning troops and their families.

With decreases in lengths of hospital stay and increases in alternatives to inpatient treatments, the field of hospital psychiatry has changed dramatically over the past 20 years. As the first comprehensive guide to be published in more than a decade, the Textbook of Hospital Psychiatry is a compilation of the latest trends, issues, and developments in the field. The textbook, written by 70 national experts and clinical specialists, covers a wide range of clinical and administrative topics that are central to today's practice of hospital psychiatry. This is the only textbook on the market today that provides information for psychiatric hospital clinicians and administrators in a single all-inclusive volume. It covers information not generally available in other textbooks and medical journals, touching on a variety of cutting-edge issues, such as safety improvement, use of seclusion and restraint, suicide prevention, and culturally competent psychiatric care. The book's 35 chapters are divided into four parts: Part I, Inpatient Practice -- focuses on specialty psychiatric units (e.g., acute stabilization unit, eating disorders unit, forensic unit, child unit), including the many psychopharmacological and psychosocial treatments used within each. This section also touches on specialized treatment for patients with co-occurring problems, such as substance abuse, developmental disabilities, and legal difficulties. Part II, Special Clinical Issues -- covers clinical issues from the perspective of different populations (consumers, families, suicidal patients). This section also examines the recent trend toward patient-centered care. Part III, The Continuum of Care -- addresses psychiatric services within the community, such as rehabilitation programs, day hospitals, and emergency services. It discusses the importance of understanding hospital-based treatment within the broader perspective of patients' lives. Part IV, Structure and Infrastructure -- focuses on such often-overlooked topics as financing of care, risk management, electronic medical records, and the actual architecture of psychiatric hospitals, as well as the roles of psychiatric hospital administrators, psychiatric nurses, and psychiatrists and psychologists. An invaluable resource for both clinicians and administrators, as well as a comprehensive teaching tool for residents, the Textbook of Hospital Psychiatry is a must-have for all professionals who work in psychiatric settings.

Approximately 4 million U.S. service members took part in the wars in Afghanistan and Iraq. Shortly after troops started returning from their deployments, some active-duty service members and veterans began experiencing mental health problems. Given the stressors associated with war, it is not surprising that some service members developed such mental health conditions as posttraumatic stress disorder, depression, and substance use disorder. Subsequent epidemiologic studies conducted on military and veteran populations that served in the operations in Afghanistan and Iraq provided scientific evidence that those who fought were in fact being diagnosed with mental illnesses and experiencing mental health-related outcomes in particular, suicide at a higher rate than the general population. This report provides a comprehensive assessment of the quality, capacity, and access to mental health care services for veterans who served in the Armed Forces in Operation Enduring Freedom/Operation Iraqi Freedom/Operation New Dawn. It includes an analysis of not only the quality and capacity of mental health care services within the Department of Veterans Affairs, but also barriers faced by patients in utilizing those services. Each year, more than 33 million Americans receive health care for mental or substance-use conditions, or both. Together, mental and substance-use illnesses are the leading cause of death and disability for women, the highest for men ages 15-44, and the second highest for all men. Effective treatments exist, but services are frequently fragmented and, as with general health care, there are barriers that prevent many from receiving these treatments as designed or at all. The consequences of this are serious for these individuals and their families; their employers and the workforce; for the nation's economy; as well as the education, welfare, and justice systems. Improving the Quality of Health Care for Mental and Substance-Use Conditions examines the distinctive characteristics of health care for mental and substance-use conditions, including payment, benefit coverage, and regulatory issues, as well as health care organization and delivery issues. This new volume in the Quality Chasm series puts forth an agenda for improving the quality of this care based on this analysis. Patients and their families, primary health care providers, specialty mental health and substance-use treatment providers, health care organizations, health plans, purchasers of group health care, and all involved in health care for mental and substance-use conditions will benefit from this guide to achieving better care.

Contemporary Issues

The exponential growth of clinical psychology since the late 1960s can be measured in part by the extensive-perhaps exhaustive-literature on the subject. This proliferation of writing has continued into the new century, and the field has come to be defined as much by its many topics as its many voices. The Oxford Handbook of Clinical Psychology synthesizes these decades of literature in one extraordinary volume. Comprising chapters from the foremost scholars in clinical psychology, the handbook provides even and authoritative coverage of the research, practice, and policy factors that combine to form today's clinical psychology landscape. In addition to core sections on topics such as training, assessment, diagnosis, and intervention, the handbook includes valuable chapters devoted to new and emerging issues in the clinical field, including health care reforms, cultural factors, and technological innovations and challenges. Each chapter offers a review of the most pertinent literature, outlining current issues and identifying possibilities for future research. Featuring two chapters by Editor David H. Barlow -- one on changes during his own 40-year odyssey in the field, the other projecting ten themes for the future of clinical psychology -- The Oxford Handbook of Clinical Psychology is a landmark publication that is sure to serve as the field's benchmark reference publication for years to come. It is an essential resource for students, clinicians, and researchers across the ever-growing clinical psychology community.

The aim of the American Psychiatric Association Practice Guideline series is to improve patient care. Guidelines provide a comprehensive synthesis of all available information relevant to the clinical topic. Practice guidelines can be vehicles for educating psychiatrists, other medical and mental health professionals, and the general public about appropriate and inappropriate treatments. The series also will identify those areas in which critical information is lacking and in which research could be expected to improve clinical decisions. The Practice Guidelines are also designed to help those charged with overseeing the utilization and reimbursement of psychiatric services to develop more scientifically based and clinically sensitive criteria.

The best-selling general psychiatry text since 1972, Kaplan and Sadock's Synopsis of Psychiatry is now in its thoroughly updated Tenth Edition. This complete, concise overview of the entire field of psychiatry is a staple board review text for psychiatry residents and is popular with a broad range of students and practitioners in medicine, clinical psychology, social work, nursing, and occupational therapy. The book is DSM-IV-TR compatible and replete with case studies and tables, including ICD-10 diagnostic coding tables. You will also receive access to the complete, fully searchable online text, an online test bank of approximately 100 multiple-choice questions and full answers, and an online image bank at www.synopsisofpsychiatry.com.

Computer Applications in Mental Health

Completely revised and updated, the fourth edition of Practicum and Internship carries on the tradition of the previous editions as a popular and highly useful textbook and resource guide. It continues to be a comprehensive resource for students and their supervisors throughout the counseling and psychotherapy process, providing thorough coverage of both the theoretical and practical aspects of the practicum and internship process. This text guides students through the important pre-professional training experiences, from the selection of an appropriate practicum site to the final evaluation of the internship. Organizing the content into four sections for clarity and ease of use, the authors discuss all the relevant information regarding the practicum experience, preparation for the internship, the internship experience and evaluation, and important ethical and legal considerations. New in this edition are a listing and description of the various counseling theories and techniques; a section on crisis intervention and response; detailed guidelines for school mental health consultation; and forms for evaluating performance, cognitive, and consulting skills. Forms are provided at the end of the book for the student's use in site selection, assessment, client treatment, and performance feedback and evaluation. These forms are also included in electronic format on an accompanying CD to allow students to modify and reuse them.

This practical book describes computer programs designed specifically for mental health clinicians and their work. It examines a variety of computer resources and some of the latest developments in the field. Computer Applications in Mental Health provides examples of computer programs that have proved helpful in private practice and institutional treatment settings. Among the programs discussed in the book are those that have succeeded or failed within the large Veterans Administration computer system; a system designed to help choose the best reinforcers to use with patients in a behavioral program; a computerized self-administered screening battery in use in community health center settings; patient education programs useful in caring for the chronic mentally ill; and a reminder system for helping the hospital-based clinician meet paperwork deadlines. Encouraging mental health professionals to investigate the types of computer technology available to them, this book also stimulates further development and sharing of computer software. To enable readers to seek out more information on certain systems and programs, this book lists many computer resources. Several of the software packages evaluated are available on computerized bulletin board systems at no cost beyond that of a long distance phone call. Although Computer Applications in Mental Health is primarily for mental health clinicians, administrators and computer programmers within mental health settings can also find useful information in this book.

"DSM-5-TR includes fully revised text and references, updated diagnostic criteria and ICD-10-CM codes since DSM-5 was published in 2013. It features a new disorder, prolonged grief disorder, as well as codes for suicidal behavior available to all clinicians of any discipline without the requirement of any other diagnosis. With contributions from over 200 subject matter experts, this updated volume boasts the most current text updates based on the scientific literature. Now in four-color and with the ability to authenticate each printed copy, DSM-5-TR provides a cohesive, updated presentation of criteria, diagnostic codes, and text. This latest volume offers a common language for clinicians involved in the diagnosis and study of mental disorders and facilitates an objective assessment of symptom presentations across a variety of clinical settings-inpatient, outpatient, partial hospital, consultation-liaison, clinical, private practice, and primary care. Important updates in DSM-5-TR include 1) fully revised text for each disorder with updated sections on associated features, prevalence, development and course, risk and prognostic factors, culture, diagnostic markers, suicide, differential diagnosis, and more; 2) addition of prolonged grief disorder (PGD) to Section II; 3) over 70 modified criteria sets with helpful clarifications since publication of DSM-5; 4) fully updated Introduction and Use of the Manual to guide usage and provide context for important terminology; 5) considerations of the impact of racism and discrimination on mental disorders integrated into the text; 6) new codes to flag and monitor suicidal behavior, available to all clinicians of any discipline and without the requirement of any other diagnosis; 7) fully updated ICD-10-CM codes implemented since 2013, including over 50 coding updates new to DSM-5-TR for substance intoxication and withdrawal and other disorders"--

The American Psychiatric Association Practice Guidelines for the Psychiatric Evaluation of Adults, Third Edition

Breaking Down

This authoritative and comprehensive title is designed to enhance best clinical practices for all healthcare providers with military service personnel and veterans. The book is organized into four sections. The first section covers foundational information on the culture and context of health care for members of the US military and veteran population. The second section focuses on systems of care for mental health needs of military and veteran populations. The third section characterizes best practices and ethical issues in clinical care for mental health needs of members of the military and veterans. Guidance in relation to a variety of clinical topics is provided, such as mood disorders, post-traumatic stress disorder, combat and operational stress, military sexual assault, psychosis, and sleep disorders. The last section is intended to assist readers in reinforcing their learning through clinical cases with accompanying questions for deeper consideration. An invaluable resource for all clinicians, allied health personnel, and administrators concerned with the mental health needs of service members and veterans, Military and Veterans Health Administration.

Health: A Comprehensive Guide is a gold-standard addition to the literature on military healthcare.

Since the publication of the Institute of Medicine (IOM) report Clinical Practice Guidelines We Can Trust in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for the inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), the American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process, APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject. For each question, a systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of the available studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist clinicians in finding clinically useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation of adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines cover the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behavior; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decisions; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations. In addition to reviewing the available evidence on psychiatric evaluation, each guideline also provides guidance for clinicians on implementing these recommendations to enhance patient care.

Increasingly more computer applications are becoming available to assist mental health clinicians and administrators in the areas of evaluation and treatment and mental health management, education, and research. Topics covered include: automated decision support systems; procedures; MR-E (The Mental Retardation Expert); computerized assessment system for psychotherapy evaluation and treatment; computer assisted therapy of stress related conditions; computerized patient evaluation in a clinical setting; computerized treatment planning; the VA national mental health database; networks; managed care; DSM-IV diagnosis; quality management; computerized knowledge coupling; telemedicine; the clinical library assistant; and monitoring independent service providers.

Integrating critical and feminist psychology, psychiatry, and psychoanalysis, this text offers a distinct perspective of posttraumatic stress disorder (PTSD) as a clinical and social phenomenon. The book draws upon interviews carried out in field settings to examine the true individual and social costs of being diagnosed with PTSD. The author examines how social contexts and social movements shape diagnostic thinking about mental trauma and how the PTSD diagnosis emerged as a symptom of a crisis in psychiatry over demands to recognize the social and political origins of mental suffering. Chapters explore case examples from a range of settings, such as military and veterans' affairs clinics, war zones and refugee camps, psychosomatic medicine, the criminal justice system, and more. Providing a new way of thinking about PTSD and an alternative to both critics and defenders of the diagnosis, this text will be useful for scholars and practitioners in psychiatry, psychology, psychoanalysis, public health policy as well as, sociology, social work, gender studies, and the law.

As of December 2012, Operation Enduring Freedom (OEF) in Afghanistan and Operation Iraqi Freedom (OIF) in Iraq have resulted in the deployment of about 2.2 million troops; there have been 2,222 US fatalities in OEF and Operation New Dawn (OND)¹ and 4,422 in OIF. The numbers of wounded US troops exceed 16,000 in Afghanistan and 32,000 in Iraq. In addition to deaths and morbidity, the operations have unforeseen consequences that are yet to be fully understood. In contrast with previous conflicts, the all-volunteer military has experienced numerous deployments of individual service members; has seen increased deployments of women, parents of young children, and reserve and National Guard troops; and in some cases has been subject to longer deployments and shorter times at home between deployments. Numerous reports in the popular press have made the public aware of issues that have pointed to the difficulty of military personnel in readjusting after returning from Iraq and Afghanistan. Many of those who have served in OEF and OIF readjust with few difficulties, but others have problems in

readjusting to home, reconnecting with family members, finding employment, and returning to school. In response to the return of large numbers of veterans from Iraq and Afghanistan with physical-health and mental-health problems and to the growing readjustment needs of active duty service members, veterans, and their family members, Congress included Section 1661 of the National Defense Authorization Act for fiscal year 2008. That section required the secretary of defense, in consultation with the secretary of veterans affairs, to enter into an agreement with the National Academies for a study of the physical-health, mental-health, and other readjustment needs of members and former members of the armed forces who were deployed in OIF or OEF, their families, and their communities as a result of such deployment. The study consisted of two phases. The Phase 1 task was to conduct a preliminary assessment. The Phase 2 task was to provide a comprehensive assessment of the physical, psychologic, social, and economic effects of deployment on and identification of gaps in care for members and former members, their families, and their communities. The Phase 1 report was completed in March 2010 and delivered to the Department of Defense (DOD), the Department of Veterans Affairs (VA), and the relevant committees of the House of Representatives and the Senate. The secretaries of DOD and VA responded to the Phase 1 report in September 2010. Returning Home from Iraq and Afghanistan: Assessment of Readjustment Needs of Veterans, Service Members, and Their Families fulfills the requirement for Phase 2.
