

The Socio Economic Impact Of Migration Flows Effects On Trade Remittances Output And The Labour Market Population Economics

The purpose of this book is to examine both the positive and negative socioeconomic impacts of artisanal and small-scale mining in developing countries. In recent years, a number of governments have attempted to formalize this rudimentary sector of industry, recognizing its socioeconomic importance. However, the industry continues to be plagued by Climate change has emerged as one of the predominant global concerns of the 21st century. Statistics show that the average surface temperature of the Earth has increased by about 1.18°C since the late 19th century and the sea levels are rising due to the melting of glaciers. Further rise in the global temperature will have dire consequences for the survival of humans on the planet Earth. There is a need to monitor climatic data and associated drivers of changes to develop sustainable planning. The anthropogenic activities that are linked to climate change need scientific evaluation and must be curtailed before it is too late. This book contributes significantly in the field of sustainable natural resource management linked to climate change. Up to date research findings from developing and developed countries like India, Indonesia, Japan, Malaysia, Sri Lanka and the USA have been presented through selected case studies covering different thematic areas. The book has been organised into six major themes of sustainable natural resource management, determinants of forest productivity, agriculture and climate change, water resource

Economics

management and riverine health, climate change threat on natural resources, and linkages between natural resources and biotic-abiotic stressors to develop the concept and to present the findings in a way that is useful for a wide range of readers. While the range of applications and innovative techniques is constantly increasing, this book provides a summary of findings to provide the updated information. This book will be of interest to researchers and practitioners in the field of environmental sciences, remote sensing, geographical information system, meteorology, sociology and policy studies related to natural resource management and climate change.

consists of six chapters. Four of them discuss the process of the COVID-19 pandemic caused by the SARS-CoV-2 virus in Europe in 2020, i.e. the directions and dynamics of the spread and its socioeconomic consequences, and provide a comparative analysis of fiscal and monetary packages employed by Europe, with an emphasis on Eastern European countries. The remaining two chapters contain forecasts and scenarios. The fifth chapter, dedicated to forecasts, provides readers with a comprehensive description of possible consequences of any epidemic leading to severe social losses such as high percentages of infected and dead, limited interpersonal contacts as a result of lockdown, a lowered level of general individual and social well-being, as well as economic losses, for example a decline in production as a result of the collapse of aggregate demand and a reduction in the supply capacity of the economy, consequently slowing down the pace of capital accumulation. The sixth, final chapter describes possible scenarios of the spread of the pandemic in Poland and Ukraine, depending on

measures taken by the governments of those countries. The *Socioeconomic Impact of COVID-19 on Eastern European Countries* is designed as a practical reference for scholars, researchers and policymakers.

The social and economic systems of any country are influenced by a range of factors. As the global population grows in developing nations, it has become essential to examine the effects of urbanization. *Urbanization and Its Impact on Socio-Economic Growth in Developing Regions* is a pivotal reference source for the latest research findings on the role of urban growth on the socio-economic infrastructures in developing regions. Featuring extensive coverage on relevant areas such as job creation, sustainability, and transportation planning, this publication is an ideal resource for city development planners, decision-makers, researchers, academics, and students interested in emerging perspectives on socio-economic development.

The development of emerging technologies demands a rapidly expanding knowledge base and intensive collaboration across organizational, institutional and cultural borders. This book focuses on the management of key emerging technologies and their social and economic impact on Europe. Split into four parts, across 17 chapters, the scholars offer multiple levels of analysis concerning the management of emerging technologies across various sectors ranging from nanotechnology, renewable energy and cloud computing to synthetic biology and particle therapy for cancer.

remittance receiving households in rural Bangladesh. Using micro-economic data from a survey conducted in 2013, statistical analysis was carried out on 300 rural households. The empirical findings provided that the valuable discrimination among the different age group of the household heads. The household unit analysis showed that remittance determinants and socio-economic impact vary from household head age group at the same community level of households. Moreover, relationship between the socioeconomic impact from remittance and demographic determinants also vary due to the age of the household head discrimination among the same rural area at the origin country.

the nature, magnitude, distribution, duration and significance of changes in the social and economic well-being of communities affected by a proposed development, has become an integral element of project planning, approval and implementation processes. This paper examines the essence of SEIA and demonstrates its applicability, using a proposed \$450m Jumbo Resort near Invermere, a small community in the southeastern interior of British Columbia, Canada, as an example. Given the large-scale nature of the project and the limited infrastructural, financial and technical capacity of the host East Kootenay Regional District, it is demonstrated that, without significant intervention by senior governments through massive financial, human resource and logistical support in addition to the creation of resource municipality at Jumbo, the project may not be socially viable, given the severity of the impacts on affected communities.

The Socio-economic Impact of the BWCAW Legislation

How we produce and consume food has a bigger impact on Americans' well-being than any other human activity. The food industry is the largest sector of our economy; food touches everything from our health to the

environment, climate change, economic inequality, and the federal budget. From the earliest developments of agriculture, a major goal has been to attain sufficient foods that provide the energy and the nutrients needed for a healthy, active life. Over time, food production, processing, marketing, and consumption have evolved and become highly complex. The challenges of improving the food system in the 21st century will require systemic approaches that take full account of social, economic, ecological, and evolutionary factors. Policy or business interventions involving a segment of the food system often have consequences beyond the original issue the intervention was meant to address. A Framework for Assessing Effects of the Food System develops an analytical framework for assessing effects associated with the ways in which food is grown, processed, distributed, marketed, retailed, and consumed in the United States. The framework will allow users to recognize effects across the full food system, consider all domains and dimensions of effects, account for systems dynamics and complexities, and choose appropriate methods for analysis. This report provides example applications of the framework based on complex questions that are currently under debate: consumption of a healthy and safe diet, food security, animal welfare, and preserving the

environment and its resources. A Framework for Assessing Effects of the Food System describes the U.S. food system and provides a brief history of its evolution into the current system. This report identifies some of the real and potential implications of the current system in terms of its health, environmental, and socioeconomic effects along with a sense for the complexities of the system, potential metrics, and some of the data needs that are required to assess the effects. The overview of the food system and the framework described in this report will be an essential resource for decision makers, researchers, and others to examine the possible impacts of alternative policies or agricultural or food processing practices.

Man's giant stride in improving his lot often generate actions and reactions which themselves pose serious threat to man himself. A major fall out of industrialization and development programmes is the assault on the integrity of the environment. Environmental degradation arising from this had impacted negatively on the quality of life and in some cases posed serious threat to wildlife, ecosystem and the human race. Sustainable development is the main goal of environmental impact assessment.

Developing economies need to grow so as to furnish better standard of living for their people. Bruntland Commission of the UN General Assembly

in 1983 emphasized the need to reconcile economic growth and development with conservation of resources upon which growth depends. According to the Commission "Humanity, has the ability to make growth sustainable to ensure that it meets the needs of the present without the future generation struggling to meet their own needs" (WCED,1987).

Greater public participation in decision that affects their environment is crucial especially grassroot involvement in local resource utilization.

COVID-19 has stirred the lives of many across the world. This epidemic has been

upgraded to Pandemic on 11 March 2020 by WHO. In its initial period, during January 2020, besides China, it had alerted only the neighbouring ASEAN countries, Taiwan, HK and Japan. Other countries were watching the new cases being reported in these countries. Authorities in these regions worked hard to contain the spread till Mid-March 2020. Then Europe felt the brunt of this Pandemic and in few weeks, it engulfed whole Europe with severe level of infection and mortality rate. Then it struck the US with even a higher infection rate than Europe but with a bit lower mortality rate. For many people, it is a calamity of unprecedented magnitude. People have been forced by this virus to stay at home. Their lifestyle has changed drastically during past 2 months because of containment measures and constant fear of getting infected. People are glued to websites that publish the daily infection number. Many of us are keen to see the flattening of infection rate curve at the earliest. Virus is still wracking the havoc even after 3 months of its origination. There are no vaccines in the sight for the next few months though more than 100 candidates are toiling to get lucky. There is a higher likelihood of arrival of a second wave of this Pandemic as happened during all previous Pandemic (Spanish flu, Asian Flu and Hong Kong Flu). Second wave in all previous Pandemics was more severe than the first wave. There are so many unknowns about the life during and after this Pandemic. There are so many unknowns for policy makers. There is a trade-off

for the policymakers to either save the economy from freefall or contain the Pandemic, save important lives and prevent further transmission. Each passing day during this Pandemic has an economic cost associated with it. This book attempts to provide a ground reality of this Pandemic from Socio-economic standpoint. It tries to understand the economic cost of this Pandemic for different regions across the globe. It also tries to delve deeper into the recent history (not too far away from the present) of past 100 years and analyse the socio-economic impact of past pandemics. Impact of previous pandemic may not be perfectly correlated with the prevailing 2020 Pandemic, but the history does provide a good baseline to understand the consequences of such Pandemics. This is my first attempt to write a book. I hope you will find this book helpful.

"This resource book discusses the economic arguments that could (and could not) be put forth to support the case for investing in the social determinants of health on average and in the reduction in socially determined health inequalities. It provides an overview and introduction into how economists would approach the assessment of the economic motivation to invest in the social determinants of health and socially determined health inequities, including what the major challenges are in this assessment. It illustrates the extent to which an economic argument can be made in favour of investment in 3 major social determinants of health areas: education, social protection, and urban development and infrastructure. It describes whether education policy, social protection, and urban development, housing and transport policy can act as health policy"--

Though globalisation of the world economy is currently a powerful force, people's international mobility appears to still be very limited. The goal of this book is to improve our knowledge of the true effects of migration flows. It includes contributions by prominent academic researchers analysing the socio-economic impact of migration in a variety of contexts: interconnection of people and trade flows, causes and consequences of capital remittances, understanding the macroeconomic impact of migration and the labour market effects of people's flows. The latest analytical methodologies are employed in all chapters, while interesting policy guidelines emerge from the investigations. The style of the volume makes it accessible for both non-experts and advanced readers interested in this hot topic of today's world.

An Introduction to Socio-economic Impact Assessment

The Socio-economic Impact of 'self-organization'

The Kurdistan Region of Iraq has been massively contaminated by landmines and unexploded ordnance. This will continue to be a major obstacle for development and economic growth, particularly in the rural border communities. The mines were used systematically by the central Baathist government in its efforts to de-populate the Kurdistan Region and to weaken the Kurds' demands for regional self-determination. This work investigates the magnitude of the landmine problem in the region, and the landmine action activities undertaken to rehabilitate, reconstruct, and develop the region. In addition to that, this work emphasizes the social, health, educational and economic impacts of landmines, as well as the legal consequences. In order to achieve the abovementioned objectives, this work is divided into fifteen chapters. After providing an introduction and background to the landmine problem, the authors discuss the scope of the problem, both in the Kurdistan Region and internationally. The methods of

Download File PDF The Socio Economic Impact Of Migration Flows Effects On Trade Remittances Output And The Labour Market Population

Economics

dealing with mines and their consequences are reviewed. The issues of landmine action, impact surveys, factors influencing the survey process, and mine actions activities are also discussed. A comprehensive review of the outcome of the problem of landmines in the Kurdistan Region has been conducted. The nature and characteristics of the problems faced by Kurds are discussed in more detailed form by looking at case studies. Here the economic, social, and health impacts of landmines in the region are assessed. The issues of the human, security, and political impacts of landmines are further addressed, followed by an assessment of mine action resources and its progress, education, and various preventive measures. Finally, a number of policy recommendations are provided to prevent the use of mines in the future, and to take legal action against landmine users for clearance, rehabilitation, and compensation issues.

This report was initially prepared to place special emphasis on the relative importance of the Indian land and people resources in the Northern Great Plains and to show some of the impacts on these Indian resources associated with coal development. This report draws heavily on studies developed for the Crow Reservation because it is the only one on which substantive coal activity is taking place and the coal resource on the reservation is reasonably well inventoried. This study of anticipated socio-economic effects can be conceptually applied to

Socio-Economic Impact of Remittances in Rural Bangladesh

Essays by Leading Scientists and Policymakers

The essays in this open access volume identify the key ingredients for success in capitalizing on public investments in scientific projects and the development of large-scale research infrastructures. Investment in science - whether in education and training or through public funding for developing new research tools and technologies - is a crucial priority. Authors from big research laboratories/organizations, funding agencies and academia discuss how investing in science can produce societal benefits as well as identifying future challenges for scientists and policy makers. The volume cites different ways to assess the socio-economic impact of Research

Infrastructures and their role as hubs of global collaboration, creativity and innovation. It highlights the different benefits stemming from fundamental research at the local, national and global level, while also inviting us to rethink the notion of “benefit” in the 21st century. Public investment is required to maintain the pace of technological and scientific advancements over the next decades. Far from advocating a radical transformation and massive expansion in funding, the authors suggest ways for maintaining a strong foundation of science and research to ensure that we continue to benefit from the outputs. The volume draws inspiration from the first “Economics of Big Science” workshop, held in Brussels in 2019 with the aim of creating a new space for dialogue and interaction between representatives of Big Science organizations, policy makers and academia. It aspires to provide useful reading for policy makers, scientists and students of science, who are increasingly called upon to explain the value of fundamental research and adopt the language and logic of economics when engaging in policy

discussions.**

Religious studies and research have gained a lot of interest and attention from researchers, policy makers, and practitioners over the last few years, but the socio-economic impacts have not been explored. Taking into account the profound economic impact the tourism and hospitality industries can have on regions and cities around the world, further research in this area is critical to analyze the extent of such impact and the ramifications that are associated with it. The Handbook of Research on Socio-Economic Impacts of Religious Tourism and Pilgrimage is a pivotal reference source that provides vital research on the social and economic factors in faith-based journeys. While highlighting topics such as tourist spending, spiritual tourism, and local development, this publication explores religious tourism in the middle age, as well as the methods of modern religious tourism. This book is ideally designed for business managers, cultural preservationists, academicians, business professionals, entrepreneurs, and upper-level students seeking current

research on religious tourism and its socio-economic impacts.

Economics

organizations today is the ever-growing competition, the continuous increase in customer expectations and customers' subsequent demands. Moreover, customers are becoming increasingly critical of the quality of services they experience. In order to be successful, firms must view stress management as an essential part of their strategic process. Increased competition has forced traditional organisations to find ways to retain current employees and to attract customers the major task of organisations is to promote customer satisfaction and loyalty while establishing a competitive advantage a major factor on customer satisfaction and loyalty is the quality. Increased service quality through increased employee performance is a viable way for organisations to remain competitive. One strategy which has gained momentum, in services, is the concept of quality and quality management. Quality can come from happy employees. The stress in the organisations reduces the talents and competencies by which the employees impact the service quality.
