has been a revered
but hard to find
textbook for the

course for decades.
This book is based
on an honors
course in advanced
calculus that the
authors gave in the

1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore

material than was
covered in any one
year. It can
accordingly be used
(with omissions) as
a text for a year's
course in advanced
calculus, or as a text
for a three-
semester
introduction to
analysis. The

prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments

and have a certain
amount of
mathematical

sophistication. As
possible

introductory texts,
we mention

Differential and
Integral Calculus by
R Courant, Calculus
by T Apostol,
Calculus by M

Mathematics by G

should also have
some experience
with partial
derivatives. In
overall plan the
book divides
roughly into a first
half which develops
the calculus
(principally the
differential

calculus.

We see teaching
mathematics as a form
of story-telling, both
when we present in a
classroom and when
we write materials for
