This book examines how neoliberalism is constituted from multiple, diverse elements; how these elements are brought together and made to cohere; and the challenges, contestations, and consequences of such. Informed by assemblage thinking, the collection builds on research that emphasizes the forms of experimentation, adaptation, and mutation through which neoliberalism is enacted and rendered workable across different spaces. Contributors provide original case studies on topics such as democratic administration, carbon markets, the sharing economy, behavioral economics, disease management, free trade, and youth volunteering. They interrogate the forms of expertise through which neoliberalism is rendered knowable; the diverse socio-technical practices that make neoliberalism governable; and the practices, effects, and tensions involved in the assembling of neoliberal subjects.

Digitized Lives

In a remarkably short period of time the Internet and associated digital communication technologies have deeply changed the way millions of people around the globe live their lives. But what is the nature of that impact? In chapters examining a broad range of issues—including sexuality, politics, education, race, gender relations, the environment, and the economy—this book seeks answers to these central questions: What is truly new about so-called "new media," and what is just hype? How have our lives been made better or worse by digital communication technologies? In what ways can these devices and practices contribute to a richer cultural landscape and a more sustainable society? Cutting through the noise, author Douglas Kellner, a leading expert on the subject, does not shy away from the darker side of the digital revolution. Reed avoids both techno-hype and techno-pessimism, offering instead succinct, witty and insightful discussions of how digital communication is impacting our lives and reshaping the major social issues of our era. The book argues that making sense of digitized culture means looking past the glossy surface of techno gear to ask deeper questions about the impact on our lives more socially, politically, and economically just world. Edible insects have always been a part of human diets, but in some societies there remains a degree of disdain and disgust for their consumption. Insects offer a significant opportunity to merge traditional knowledge and modern science to improve human food security worldwide. This publication describes the contribution of insects to food security and the use of insects as food and feed. Insects can be used to control agricultural pests, insects at a commercial scale to improve food and feed production, diversify diets, and support livelihoods in both developing and developed countries. Edible insects are a promising alternative to the conventional production of meat, either for direct human consumption or for indirect use as feedstock. This publication will boost awareness of the benefits of insects to food security, nature and human life, and it will stimulate debate on the expansion of the use of insects as food and feed.

Recently developed genomic tools, like SNP-genotyping and whole genome sequencing, and their analysis, offer great opportunities for the conservation and utilisation of animal genetic diversity, both among and within breeds. These genomic tools can be used to detect potentially valuable rare alleles and haplotypes. They are important parts of the genetic diversity we need to conserve now for possible utilisation in the future. This book describes the use of genomic technology to define breeds, to measure diversity and to assess important features in the history of breeds affecting the present genetic diversity. The management of genetic diversity with genomic tools is outlined both in vivo: small populations of rare breeds or large populations with small effective population sizes and in vitro: genebanks. Special attention is given to the genomic management of populations of animals with high incidences of genetic defects. This book is intended for MSc and PhD students, scientists working with small populations in animal breeding and in conservation programmes for rare breeds.
