Proceedings of ASM International's 1993 Conference. In this volume, the papers describe real-world applications of putting composites to work. Once thought of as solutions in search of problems, many of these composites are being mainstreamed into commercial applications. Nearly one-third of the book deals with physical and mechanical properties of ceramic matrix composites; other areas covered in detail are processing and characterization of intermetallic matrix composites and metal matrix composites; processing, fabrication and application of polymer matrix composites, fabrications of functionally gradient materials, and processing applications of carbon-carbon composites. Contributing authors hail from university, government and defense research facilities, as well as from aerospace companies across the country.

Contains the proceedings of the Association.

More than 30,000 listings are presented in this edition with increased coverage from major steel producing countries such as China, India, and Japan.

A companion volume to the Worldwide Guide to Equivalent Irons and Steels, this reference book gives you the same complete coverage and identical format for nonferrous metals and alloys. Completely updated and expanded from the previous edition, it's an absolute must if you're involved with materials specifying in any way. This comprehensive volume is well-indexed with easy to use cross references that make short work of looking up equivalents for a material specification or designation. It provides valuable composition tables and allows you to compare similar alloys. Tensile properties and product forms are provided when available. If you work in the international marketplace, it's especially ideal for identifying foreign specifications, finding similar alloys and verifying compositional limits. This book is organized by material group or class such as aluminum, copper, lead, magnesium, nickel, tin, titanium, and zinc. Each is further subdivided into groups, then finally into individual alloys. It's a must for metallurgists in design and manufacturing, materials producing companies, distributors and purchasing agents for metallic alloys, design and environmental engineers, academic and institutional libraries and information centres.

Required reading for any librarian who has been asked to identify standards and specifications, this unique new book highlights the importance of standards in many sci-tech libraries. Collections of standards in sci-tech libraries encompass a great variety--from the most narrow subject fields, to those covering many, and from collections of American standards only, to those with an international array. *Role of Standards in Sci-Tech Libraries* addresses the need for standards in libraries and provides crucial guidelines for developing standards collections. The first chapter describes the operation and collections of the ideal service that could be established to serve those needing standards and to promote the use and collection of standards. A helpful list of foreign and domestic organizations that issue standards is included. Successive chapters explore the role of standards in different types of libraries--a public library's science and technology department, a corporate library, an academic library, and the library of the National Institute of Standards and Technology (NIST). The final chapter addresses the role of Information Handling Services (IHS), a commercial source of all types of standards, discusses the range of standards services, and explains how information is acquired.

Computerization and Networking of Materials Data Bases

This Special Issue addresses the important issue of the energy efficiency of both manufacturing processes and systems. Manufacturing is responsible for one-third of global energy consumption and CO2 emissions. Thus, improving the energy efficiency of production has been the focus of research in recent years. Energy efficiency has begun to be considered as one of the key decision-making attributes for manufacturing. This book includes recent studies on methods for the measurement of energy efficiency, tools and techniques for the analysis and development of improvements with regards to energy consumption, modeling and simulation of energy efficiency, and the integration of green and lean manufacturing. This book presents a breadth of relevant information, material, and knowledge to support research, policy-making, practices, and experience transferability to address the issues of energy efficiency.

The only source that focuses exclusively on engineering and technology, this important guide maps the dynamic and changing field of information sources published for engineers in recent years. Lord highlights basic perspectives, access tools, and English-language resources--directories, encyclopedias, yearbooks, dictionaries, databases, indexes, libraries, buyer's guides, Internet resources, and more. Substantial emphasis is placed on digital resources. The author also discusses how engineers and scientists use information, the culture and generation of scientific information, different types of engineering information, and the tools and resources you need to locate and access that material. Other sections describe regulations, standards and specifications, government resources, professional and trade associations, and education and career resources. Engineers, scientists, librarians, and other information professionals working with engineering and technology information will welcome this research
